lighter, faster

THANK YOU

Congratulations, you've just bought one of the best lightweight bars in the world!

Bar set-up:

As with all lightweight carbon bars, lower clamping force reduces the stress on the bar. Carbon assembly paste is useful to apply to improve grip and reduce the torque needed. Ensure you tighten the bolts on the stem equally to reduce pinching, and there are no rough edges on the stem/controls. Tighten carefully ... as soon as things feel solid, stop tightening.

On the Ultralight/Bar End friendly (580/640mm) bars: Maximum recommended torque for the controls is 4 Nm for the stem area (and bar end friendly ends) & 2.5 Nm for the lever controls.

On the "heavier" 740mm bars: Maximum recommended torque for the bar is 5 Nm.

Warranty: 1 year warranty from date of purchase. We'll replace any defective product. We'll be fair, please be fair as well.

Crash Replacement: If you crash and brake/over torque one of our products we run a simple discounted replacement policy.

Simply, you can replace the product for 50% of the RRP + postage.

Feel free to get in contact on anything at: info@mtzoom.com
